#### Describe the present and original (if known) physical appearance

The Wilson-Courtney House is a  $l_2$  story frame dwelling. It is composed of a rectangular front 47'6" wide x 36'5" deep, with an ell 30'3" wide by 34'5" deep extending to the rear. The exterior and interior display elements of Greek Revival architecture. The house faces west.

The original cellar is a 15' x 16' room beneath the ell. It is lined with the original hand made bricks measuring  $2\frac{1}{2}$ " x 4" x 8'". This room was probably used for cold storage and salting meat, as is evidenced by the intact stone trough along the east wall. When central heating was added, the cellar was enlarged. The sills and summers are 11" x 12", hand hewn beams running the length and width of the house. On these rest sash-sawn floor joists measuring  $2\frac{1}{2}$ " x 10". The joists support 5" wide floor planks. The sills were originally supported by brick piers ranging in height from 1'4" to 2' off the ground. Later, the spaces between the piers were filled in with brick.

The original front porch was narrower than the present one and had its gable end facing forward. A tree fell on this porch and it was replaced by the present one. The front door (3'3" x 6'll") is original and paneled with mortise-and-tenoned members pegged in the corners. There are Greek Revival style side lights and transom lights around the door. There are four pilasters evenly spaced across the front. The ridge line of the roof runs parallel to the front of the house and there are classical returns on the gable ends. The siding is lapped clapboards 4" wide. On the rear side of the roof there is a centrally placed dormer window.

On the first floor of the Wilson-Courtney House there is a central hall with two rooms symmetrically placed on each side. The central hall is 9' wide and contains the stairs to the second floor. The four rooms are all 18' wide by 17'4" deep. In the two rooms on the south side there are fireplaces while the two rooms on the north side have brick flues for stoves. All of the interior doors are original, being paneled with mortise-and tenoned, pegged members.

The rear ell contains the kitchen which also has a fireplace. What were originally the servant's quarters are now used as a family room and bathroom. An originally open, interior porch adjacent to the kitchen is now enclosed. A bay window has been added to the rear of the family room.

On the second floor there is one room on each side of the central hallway, each with two windows in the gable end. The end of the central hallway faces onto the dormer.

In the attic above the ell the construction is visible. The timbers are hand hewn and pegged together. The sash-sawn rafters are  $2\frac{1}{2}$ " x  $3\frac{1}{2}$ ". The roof decking is as wide as 22" and still has the bark on its edges. The roof has been replaced.

Near the Wilson-Courtney House there is a two room outbuilding measuring  $15'4" \times 22'3"$ . One of its rooms was used as a smokehouse. It is of frame construction with tongue-ingroove clapboards. All of the lumber is sash-sawn and mortise-and-tenoned together.

#### 8. Significance

Statement of Significance (in one paragraph)

The Wilson-Courtney House is significant as a fine, well-preserved example of early Indiana architecture. The dwelling shows how a reasonably well-off farmer would have lived in Indiana during its initial settlement. The house is also significant as a local landmark to the community.

Having been built between 1848 and 1850, the Wilson-Courtney House is one of the earliest houses in the Danville area. Its design and construction techniques are representative of the period. Its Greek Revival style (the pilasters, sidelights, transom lights, and classical returns) is characteristic of the better houses being built in the settlement areas at this time.

The well preserved state of the Wilson-Courtney House shows the construction techniques employed at the time. The timbers are hand hewn showing the marks of the broad ax. The joints are all wood pegged and mortise-and-tenoned. The straight saw marks on the joists show that they were sawn by a vertical mill saw and the wide decking attests to the width of the trees cut down to build the house. Other features of interest are the pegged doors, chimneys, hand hewn bricks, fireplaces, and smokehouse.

The house is also significant in local history. The Matlock family, who built the house, were prominent in early Danville as merchants. The house was well known and "became a social center for the 'first families' of Danville..." Still today the house is known to Danville residents as "the Courtney place" and its presence helps maintain this local history.

The house was built for David Matlock's daughter, Mary, after her marriage to David Wilson. The farm passed from Matlock to the Wilsons, and later to their daughter Sarah, who married Edward Courtney. The farm left the family in 1936.
