There are two basic types of archaeological evidence which indicate the presence of an archaeological site:

1. **Artifacts** are defined as any portable object made and/or used by humans.
2. **Features** are defined as non-portable evidence of past human behavior, activity, and technology.

Both artifacts and features may be precontact or historical. Precontact artifacts and features are Native American in origin and date to before recorded history in Indiana, ca. 10,000 B.C. to 1500 A.D. Historical artifacts and features in Indiana date after this time and refer to peoples of many ethnic and cultural backgrounds. These include Native Americans, and many people of Old World cultural backgrounds who settled and populated the region which became the state of Indiana.

**Artifacts** may be made of a number of raw materials, the most common of which are: chipped stone, ground stone, ceramic, bone, shell, wood, fibers, glass, and metal. These often take the form of tools, weapons, utensils, ornaments, and artistic and ceremonial items. These artifacts may have been used in relation to a number of activities, including architecture; food procurement, preparation, and consumption; defense; toolmaking; clothing; personal use and recreation; household activities; ceremonies and rituals; transportation, etc.

**Features** may be recognized by the presence of non-portable evidence of past human activities. Common evidence of features includes soil stains of a different color or texture than the surrounding natural soils, burned earth, ash and charcoal lenses and pits, clusters of artifacts, pits, foundations and structural remains, evidence of old postholes, the presence of human or animal bone, and earthworks or embankments.

**Precontact features** commonly include fire pits and hearths, burned earth and clay, trash and garbage pits, postholes, evidence of house floors or basins, storage pits, clusters of artifacts (e.g., chipped and broken stones, caches of projectile points, ceramics or pottery sherds), human and animal burials, clusters of animal bone, and earthworks (such as mounds and circular enclosures), petroglyphs and pictographs (respectively symbols carved or pecked into stone and painting or drawings on stone), and middens (cultural refuse buildup).

**Historical features** include evidence of fires and fire pits, ash and charcoal lenses and stains, trash and garbage pits and dumps, middens, postholes, house foundations and other structural remains (e.g., wells, cisterns, fencelines, ditches, canals, landscapes, embankments, mill races, dams, old trails and roads), cemeteries, human burials, and clusters of historical artifacts.

Some common site types include refuse heaps and/or dumps, old homesteads and farmsteads, artifact caches, villages and camps, cemeteries, family plots, burials, workshops (e.g., stone, metal, ceramic), quarries, garden and field plots, earthworks (mounds, embankments, dams, enclosures, fortifications, canals, etc.), old parks and cultural landscapes, old trails and transportation routes, mills, towns, mines and mining camps, and industrial and business sites.
