GROUND-WATER RESOURCES OF WEST-CENTRAL INDIANA

Preliminary Report: Owen County

By F. A. Watkins, Jr., and D. G. Jordan

ABSTRACT

Owen County, in west-central Indiana, has an area of about 391 square miles. Consolidated rocks of Mississippian and Pennsylvanian age and unconsolidated rocks of Pleistocene age are the sources of ground water for domestic, stock, industrial, and two municipal supplies. Wells in Owen County vary greatly in depth and yield. Wells tapping Mississippian rocks range in depth from about 20 to 550 feet and in yield from less than 1 to about 100 gpm, while those tapping Pennsylvanian rocks range in depth from about 20 to 300 feet and in yield from less than 1 to about 20 gpm. Some wells tapping the consolidated rocks yield no water. Wells tapping Pleistocene sand and gravel range in depth from about 20 to 220 feet and in yield from about 1 to 300 gpm. Field chemical analyses of water from these sources show that the chemical quality differs greatly. A modal grouping was used to find the most frequent values for the hardness of water and for the chloride and sulfate content of the ground-water in Owen County. This method yields the following results: for water from aquifers of Mississippian age: hardness, 275 ppm; chloride, 11 ppm; and sulfate, 18 ppm; for waters from aquifers of Pennsylvanian age: hardness, 101 ppm; chloride, 11 ppm; and sulfate, 20 ppm; and for waters from aquifers of Pleistocene age: hardness 271 ppm; chloride 11 ppm; and sulfate, 14 ppm. Locally, either the iron, sulfate or chloride content exceeds the recommended standards of the U. S. Public Health Service (1946) for drinking water.

This preliminary report contains tabulated records of about 355 wells and other drilled holes giving information about well construction, water levels, conditions of occurrence and characteristics of the water-bearing material; selected logs of about 146 wells and other drilled holes giving the drillers' description of the material encountered and a tentative interpretation by the authors of the geologic age; records of 19 springs giving information about geologic source, yield and temperature of the water; results for 187 field chemical analyses of water from wells, 17 field chemical analyses of water from springs, and 31 field chemical analyses of water from streams, giving the hardness and the bicarbonate, chloride, iron, and sulfate content; and water levels in 5 observation wells indicating the magnitude of short and long-term water-level fluctuations in the consolidated and unconsolidated rocks. These basic data include much of the material to be used in an interpretive report on the ground-water resources and geology of the area.

A base map of Owen County shows the location of all water wells, holes drilled for purposes other than water supply, springs, and stream sampling sites listed in this report. Additional maps show availability of ground water and generalized quality of water conditions with respect to hardness, and areas of high sulfate content.

INTRODUCTION

Purpose and Scope

An investigation of the ground-water resources and geology of nine counties in west-central Indiana has been conducted intermittently since 1950. In 1956, the investigation was placed on a full-time basis and another county was added to the area of study. This investigation is being made by the U. S. Geological Survey in cooperation with the Division of Water Resources, Indiana Department of Conservation, as a part of a broad program of these agencies to inventory and evaluate the ground-water resources of Indiana.

This report is the fifth of a series of preliminary reports to be published on the ground-water resources and geology of west-central Indiana. The purpose of this report is to make the basic data collected during the investigation available to the public and to provide a preliminary evaluation of the geology and the ground-water conditions as an aid to the development of the ground-water resources. A more detailed and comprehensive analysis will be published in an interpretive report on the ground-water resources and geology of the area.

The investigation was made under the general direction of A. N. Sayre and P. E. LaMoreaux, successive chiefs of the Ground Water Branch of the U. S. Geological Survey, and under the immediate supervision of F. H. Klaer and C. M. Roberts, successive district geologists of the Ground Water Branch for Indiana.

Location and Areal Extent

Owen County is located in the west-central portion of Indiana (fig. 1). The county is roughly rectangular in shape and has an area of about 391 square miles. It is bounded on the north by Putnam and Morgan Counties, on the east by Morgan and Monroe Counties, on the south by Greene County, and on the west by Clay County.

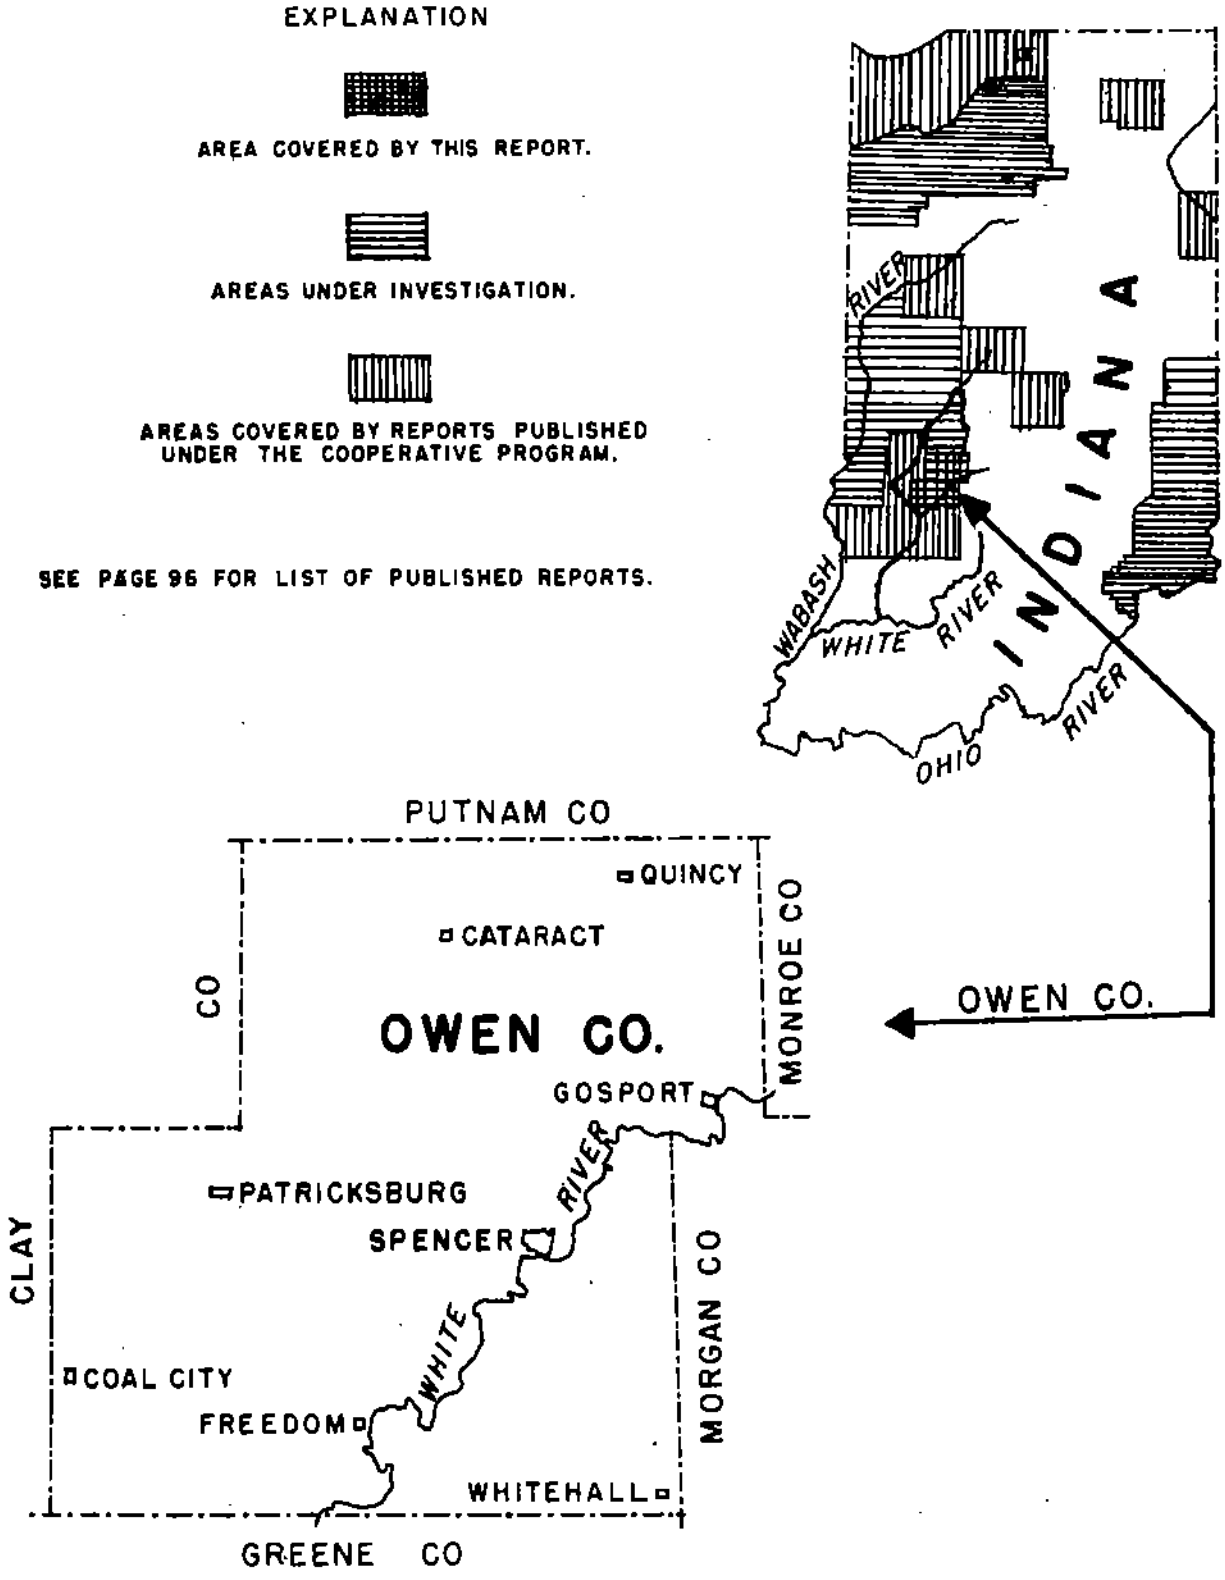

FIGURE 1.--Map of Indiana showing area covered by this report, areas under investigation and areas covered by reports published under the cooperative program.

Well-numbering System

A numbering system is used to locate and identify the wells, holes drilled for purposes other than water supply, and springs in this report. The number assigned indicates the location according to the official rectangular survey of public lands. For example, in the number for well 11/3W-34K1, the part preceding the hyphen indicates that the well is in T. 11 N., R. 3 W. The first number after the hyphen indicates section in which the well is located. Each quarter-quarter section (40-acre tract) within a section is given a letter symbol as shown on Figure 2. Within the quarter-quarter section, wells are numbered serially. Therefore, well 11/3W-34K1 is the first well listed in NW¼SE¼ sec. 34, T. 11 N., R. 3 W.

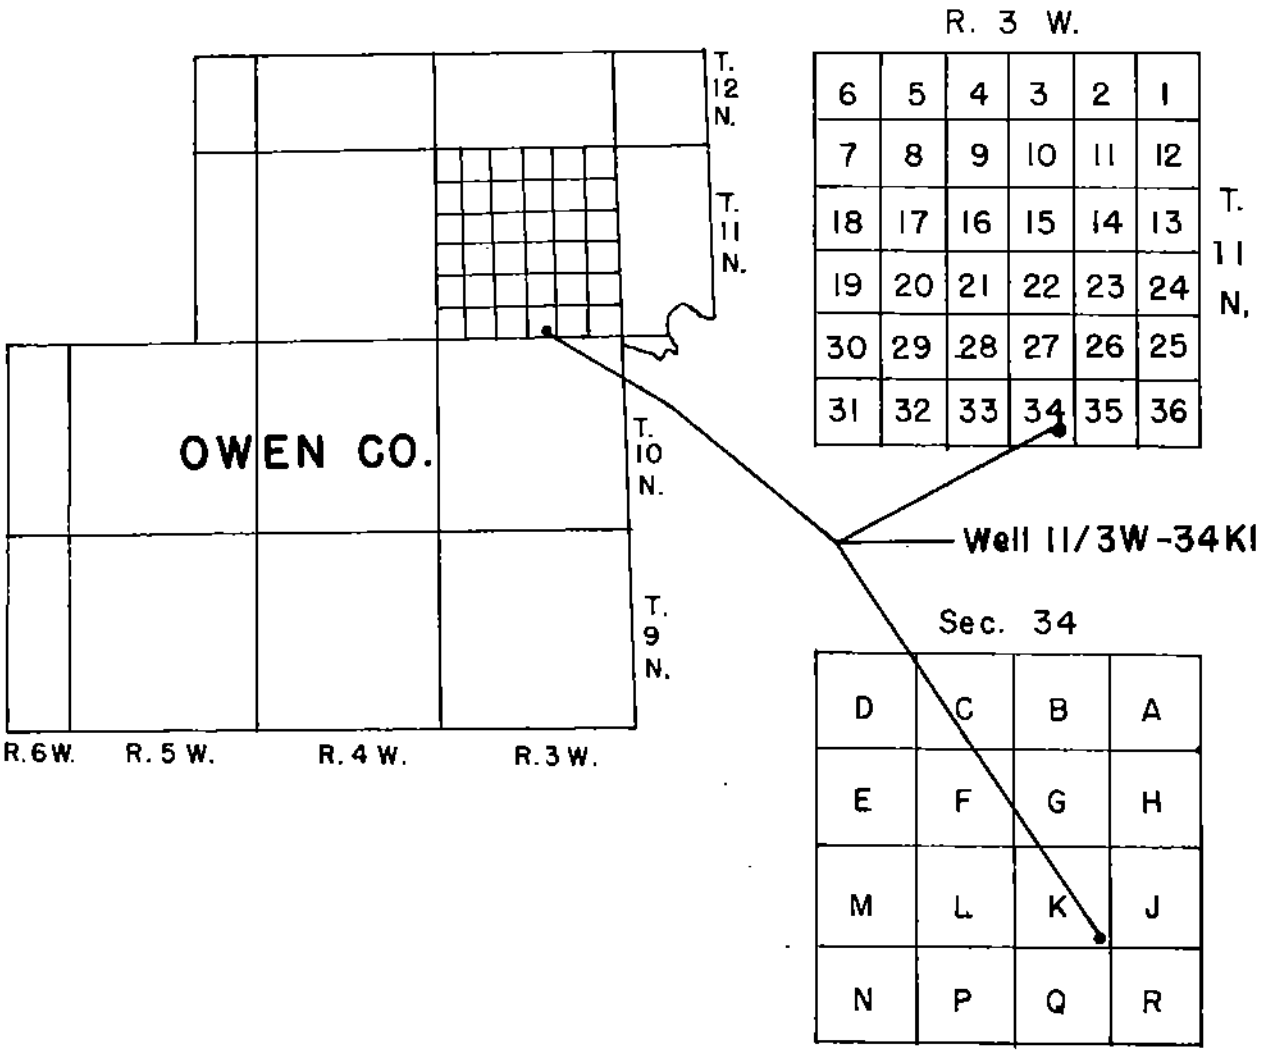

FIGURE 2.--Sketch showing well-numbering system.

Acknowledgments

The authors thank all persons who contributed time, information, and assistance during the collection, tabulation, and processing of data for this report. We especially thank the well drillers listed in the table of well records who furnished much of the information summarized in tables 3 and 4.

The authors also thank the following government agencies which provided information for the report: the Division of Oil and Gas and the Division of Water Resources, both of the Indiana Department of Conservation; and the Indiana State Highway Department.

DATA COLLECTION AND PROCESSING

The well data were collected from drillers, water works superintendents, and others. The well records obtained from drillers were of two types--written records and reports from memory. A tentative driller's location of the well record was obtained at the time of collection and this was checked against the property records in the county courthouse to verify the location, to locate the property, and to obtain the name of the current property owner. Any discrepancy between the driller's location and the location shown in the plat book was corrected. The well location was then checked in the field and its location plotted on the appropriate U. S. Geological Survey 7½-minute topographic quadrangle map. The locations given on the records of test holes, oil or gas exploration holes, and wells from other reports were accepted without further verification.

Plate 1 shows the location of water wells, oil wells, test holes, or holes drilled for purposes other than water supply, springs, and stream sampling sites. All locations are accurate to the nearest quarter-quarter section and most locations are shown to the nearest 10 acres or quarter-quarter-quarter section. The basic data for these wells and holes drilled for purposes other than water supply are summarized in table 3. Selected drillers' logs of wells and other drilled holes with tentative interpretations by the authors of the geologic age of the materials encountered are given in table 4. Basic data for the springs are summarized in table 6.

Samples of water were collected at the time well and spring sites were visited and from streams during a period of low flow. The samples were analyzed in the field for hardness of water, alkalinity (expressed as bicarbonate) and chloride content by standard titration methods. Sulfate was determined by a turbidimetric method using a colorimeter when concentrations were below 100 ppm (parts per million) and by a standard titration method when concentrations exceeded 100 ppm. The iron content was determined at the well site by the bipyridine method using visual comparison with standard color ampules having known iron concentrations. The results of these analyses (tables 5, 6, and 7) were used to select sites for collecting water samples for more comprehensive analyses by the U. S. Geological Survey.

During the investigation observation wells were established to measure the fluctuations of water level. Table 8 contains water-level measurements obtained from these wells. The data from these observation wells show the effect of seasonal and longer term variations of the ground-water level.

General Geology and Sources of Ground Water

Consolidated rocks of Middle and Late Mississippian age and of Early Pennsylvanian age crop out in Owen County. Overlying these rocks are unconsolidated glacial deposits of Pleistocene age. These glacial deposits mantle the entire county with the exception of a small area in the southeast corner of the county.

Rocks of Mississippian age that crop out in the eastern two-thirds of the county are extensively used for domestic and stock supplies and a few small industrial supplies. The limestones of Middle Mississippian age are the principal source of ground water although in the northeast portion of the county some water is obtained from siltstones that underlie the limestones. Sandstones and in a few places limestones of Late Mississippian age are minor sources of ground water. Wells tapping aquifers of Mississippian age range in depth from about 20 to 550 feet with the average depth being about 110 feet. Yields from these wells range from less than 1 to about 100 gpm with some dry holes reported.

Rocks of Early Pennsylvanian age crop out in the western third of the county. These rocks consist chiefly of sandstone, sandy shale, shale, and minor amounts of coal and limestone. Sandstones are the principal source of ground water from these rocks and are used for domestic and stock supplies. Well depths range from about 20 to 300 feet, the average depth being about 105 feet. Yields from these wells range from less than 1 to about 20 gpm with some dry holes reported.

Unconsolidated glacial deposits of Pleistocene age overlie the consolidated rocks except in the southeast portion of the county. These deposits consist of till, glaciofluvial sand and gravel, and lake sediments.

Glaciofluvial sand and gravel were deposited in pre-glacial valleys in the northwest corner of the county and elsewhere in the county in similar valleys whose courses are more or less followed by the present Fish Creek, Rattlesnake Creek, Eel River, and White River. Much of the sand and gravel deposited along Fish and Rattlesnake Creeks has been removed by erosion. In the northwest corner of the county and along the Eel River and White River, much of the sand and gravel has been removed but enough remains that these deposits are an important source of ground water for domestic, stock, and potential industrial supplies. The two municipal supplies in the county are located along the White River in these deposits. Well depths in these deposits range from about 30 to 100 feet and yields range from about 1 to 300 gpm. Relatively large yields are possible from these sands and gravels.

Small amounts of glaciofluvial sand and gravel are associated with clayey and sandy-clay till in the county. The sand and gravel were deposited as lenses or thin stringers on the bedrock surface and covered by till or as lenses or thin stringers interbedded with till. There is a close relationship between the pre-glacial bedrock channels and the sand and gravel deposits. In many areas these deposits are or with proper development could be additional sources of ground water for domestic and stock supplies. In the pre-glacial upland areas the glacial deposits consist chiefly of a clayey to sandy-clay till and do not yield water freely.

Lake sediments are present in several areas in Owen County along the tributaries of White River and in the pre-glacial Mill Creek valley. These sediments were deposited on bedrock or on glaciofluvial sand and gravel. The lacustrine deposits consisting chiefly of silt and clay do not yield water freely but in areas where interbedded sand and gravel lenses are present they may be potential sources for domestic and stock supplies.

Wells tapping the sand and gravel aquifers associated with till and lacustrine deposits range in depth from about 20 to 220 feet and have yields ranging from about 1 to 35 gpm. At the present time many of the wells drilled in these areas pass through the sand and gravel deposits and are completed in the bedrock.

Deposits of Recent age in Owen County are thin and consist mostly of flood plain sediments and wind-blown sand and are not important as sources of ground water.

Plate 2 shows availability of ground water in the consolidated and unconsolidated rocks underlying the county. In addition, plate 3 shows generalized quality of water conditions in the consolidated and unconsolidated rocks with respect to hardness. This map also shows areas where the sulfate content exceeds the limits for this constituent as established by the U. S. Public Health Service (1946).

The hardness and the chemical content of water vary greatly in the aquifers of Mississippian and Pennsylvanian age and to a lesser extent in aquifers of Pleistocene age. The maximum and minimum values and the mode 1/ for hardness and chloride and sulfate content of water for each group of aquifers is given in table 1.

Table 1.--Comparison of quality of ground water by source in Owen County

Pleistocene

	Hardness, ppm	Chloride, ppm	Sulfate, ppm
Maximum	645	110	515
Minimum	15	1	5
Mode	271	11	14

Pennsylvanian

Maximum	1,720	225	1,760
Minimum	2	3	10
Mode	101	11	20

Mississippian

Maximum	1,100	3,400	900
Minimum	40	2	5
Mode	276	11	18

1/ mode: The item, in a series of statistical data, which occurs oftenest.

CONFINED AND UNCONFINED CONDITIONS

In Owen County ground water occurs in the consolidated and unconsolidated rocks chiefly under confined (artesian) conditions, but in some places it occurs under unconfined (water-table) conditions. Under confined conditions, the saturated water-bearing material (aquifer) is overlain directly by relatively impervious material, and the water in the well bore which is confined in the aquifer under pressure, will rise above the bottom of the impervious material. Under unconfined conditions, the water-bearing material (aquifer) is overlain directly by permeable unsaturated material, and the water does not rise above the level at which it is encountered.

TYPES OF WELLS

Drilled wells are the principal type of water wells used in Owen County. A small number of dug and driven wells are still in use and occasionally one is constructed. Most water wells are 6-inches or more in diameter and are constructed by the cable-tool or percussion method of drilling. A well drilled by the cable-tool method is constructed by a combination of drilling, bailing, and driving casing. When the water-bearing material is consolidated rock, the well casing generally is driven a few inches to several feet into rock, and the well finished as an open hole in rock. When the water-bearing material is sand and gravel, the well casing is driven into the water-bearing zone and either left as an open-end casing, or the lower end of the casing is slotted or perforated, or a well screen is set opposite the water-bearing zone below the end of the casing. A modification of the above type, the gravel-packed well, has a gravel lining between the screen and the water-bearing material.

In Owen County the majority of industrial and municipal supply wells drilled in sand and gravel are equipped with wire-wound well screens--a few are finished with slotted or perforated casing. Most domestic and stock wells that have been constructed in sand and gravel do not use a screen but are finished with an open-end casing or the casing is slotted or perforated. The use of wire-wound, gauze-wrapped, or gauze washer well points or screens in domestic and stock wells is becoming more widespread. Successful wells can be obtained by the use of screens, in many water-bearing sand and gravel deposits from which it was conce considered impossible to obtain water. Table 2 relates the grain-size in inches and millimeters to the slot and gauze size of screens commonly used in water wells.

Table 2.--Grain size and equivalent screen openings

Grain size: After Wentworth (1922).
Equivalent screen openings: From commercial catalogs for water-well supplies.
Slot size: In thousandths (0.001) of an inch.
Gauze size: Number of wire strands per lineal inch.

Material	Grain size		Equivalent screen opening	
	Inches	Millimeters	Slot size	Gauze size
Gravel----------	≥0.08	≥2	≥80	--
Very coarse sand--	.04 - .08	1 - 2	40 - 80	20
Coarse sand-------	.02 - .04	.50 - 1	20 - 40	40 - 20
Medium sand-------	.01 - .02	.25 - .50	10 - 20	60 - 40
Fine sand---------	.005 - .01	.125 - .25	6 - 10	90 - 60
Very fine sand----	.002 - .005	.062 - .125	-------	-------
Silt--------------	.00015 - .002	.004 - .062	-------	-------
Clay--------------	≤.00015	≤.004	-------	-------

In areas where the water level in the unconsolidated material is close to the surface, some water wells are constructed by driving or digging. The driven well consists of a small diameter pipe with a drive-point screen on the end which is driven into shallow water-bearing material. The dug well is constructed by digging a hole, usually about 3 feet in diameter into the upper part of the water-bearing material and using concrete pipe, tile, brick, or stone as a casing.

The oil or gas exploration holes, test holes, and holes drilled for purposes other than water supply are drilled by either the cable-tool or rotary method in Owen County.

SUMMARY

Preliminary evaluation of the basic data shows that adequate quantities of ground water are generally available for domestic and stock use from the rocks of Mississippian and Pennsylvanian ages. In the sand and gravel of Pleistocene age, along the Eel River and the White River, and possibly the northwestern part of the county, ground water is available in adequate quantities for domestic and stock use and locally for industrial, irrigation, and public supplies. These sand and gravel deposits are the source of all large-yield wells in Owen County. Another source of domestic and stock supplies are the sand and gravel deposits interbedded with and overlain by till in the preglacial bedrock channels and sand and gravel interbedded with the lake sediments.

The quality of the water from the rocks of Mississippian, Pennsylvanian and Pleistocene ages varies greatly. Locally, water from these sources exceeds the U. S. Public Health Service (1946) drinking-water standards for either iron, chloride, or for sulfate content.

RECORDS

The records of about 355 water wells and holes drilled for purposes other than water supply are given in table 3. The table gives information about well construction, water levels, yields, and drawdowns, thickness and characteristics of the water-bearing material, conditions of occurrence, use and other pertinent data. The altitude of the land surface at all wells, except oil or gas exploration holes was determined from topographic maps. Altitudes of oil or gas exploration holes were on the records when received and were checked against the topographic maps.

Table 4 contains the selected logs of about 146 wells and other drilled holes. This table gives the drillers' description of the material encountered, pertinent remarks with regard to the material, and tentative interpretation by the authors of the geologic age of the material. The logs contain local terms used by drillers in describing the material penetrated. A glossary of drillers' terms is on page 10.

The results of 187 analyses of well waters are given in table 5. These chemical analyses were determined in the field by the U. S. Geological Survey. The table gives information about geologic source, temperature, concentration in ppm (parts per million) of iron, alkalinity (expressed as bicarbonate), sulfate, chloride, and hardness of water. The U. S. Public Health Service (1946)

drinking-water standards state the chemical constituents should not exceed the following concentrations: iron and manganese (together), 0.3 ppm; sulfate, 250 ppm; chloride, 250 ppm. Although no official standards have been established for hardness of water, the following classification is in general use: 0-60 ppm, soft; 61-120 ppm, moderately hard; 121-200 ppm, hard; more than 200 ppm, very hard. Water having a hardness of more than 200 ppm requires softening for many purposes.

Records of 19 springs are given in table 6. This table gives geologic sources, yield, use, temperature of water, and the results of field chemical analyses for 17 springs.

The results of 31 field chemical analyses of water from streams in Owen County are given in table 7.

Water levels in 5 observation wells in Owen County are given in table 8. The water levels in these wells were made with an engineer's steel tape. Portions of the records of three of the wells were obtained by recording gages. Daily high-water levels are given for observation wells equipped with recording gages, and periodic water levels are given for the observation wells that were measured manually. The locations of these observation wells are shown on plate 1.

GLOSSARY OF DRILLERS' TERMS

Coal fault.--An irregularity in the coal, especially of places where the coal is more or less displaced by fire clay, shale or sandstone.

Hardpan.--A hard impervious layer, composed chiefly of clay, cemented by relative insoluble materials, does not become plastic when mixed with water.

Jack.--Black, carbonaceous shale or a clayey or shaly coal.

Pan.--Clay of glacial origin generally contains small pebbles and occasional boulders.

Red rock.--Red, soft to hard, sometimes sandy shale.

Shelly.--Thin and usually hard layer or rock; rock which splits in thin pieces parallel with the bedding surface; a fossiliferous rock.

Slate.--Hard shale which splits into thin platy fragments, usually black in color.

Soapstone.--Hard, smooth, clay or shale, slippery to the touch.

Softpan.--Hard impervious layer, composed chiefly of clay, partially cemented by relative insoluble materials, becomes plastic when mixed with water.

Sulfur.--Thin band or layer of pyrite in a coal seam.

Wash.--Water laid glacial material consisting of sand, silt, and clay with a high percentage of twigs, leaves, and other organic material.

Table 3.--Records of wells, Owen County, Indiana

Well number: See text for description of well-numbering system.
Altitude: Altitude of land-surface datum from topographic map.
Type of well: Dr, drilled; Du, dug.
Finish: Gp, gravel pack; Oe, open end; Oh, open hole; P, perforated casing; S, screen.
Material: Cl, clay; G, gravel; Ls, limestone; S, sand; Sd-cl sandy clay; Sd-sh, sandy shale; Sh, shale; Sh-ls, shaly-limestone; Ss, sandstone.
Geologic age: Pl, Pleistocene; P, Pennsylvanian; M, Mississippian.
Ground-water occurrence: C, confined (artesian); U, unconfined (water table).

Water level: In feet below land-surface datum on date of completion of well, except as noted in remarks. F, flowing well.
Use: D, domestic; Do, destroyed; I, industrial; N, not used; O, observation, Og, oil or gas; P, public supply; S, stock; T, test.
Remarks: A, field chemical analysis in Table 5; E, electric log on file; L, log in Table 4; La, log on file; Lm, log from memory on file; Lz, log from memory in Table 4; Sa, sample study on file; W, water level measurements in Table 8; Dd, drawdown; gpm, gallons per minute.

Table 4.--Selected well logs, Owen County, Indiana
Remarks: T.D., total depth in feet, complete log or sample log not given; W.B., water bearing

Well 9/3W-2E2

Type of record: Log from owner (memory). Altitude: About 800 feet.

Material	Thickness (feet)	Depth (feet)	Remarks
Quaternary system:			
Recent and Pleistocene series:			
Sand, red to gray	130	130	Logs at 108 to 124 ft
Mississippian system:			
Meramec series:			
Rock	---	130	

Well 9/3W-3Q1

Type of record: Driller's log. Altitude: About 770 feet.

Quaternary system:			
Recent and Pleistocene series:			
Soil, white to yellow	18	18	
Gravel and sand, water worn	6	24	W.B.
Quicksand	27	51	
Mississippian system:			
Meramec series:			
Limestone	92	143	

Well 9/3W-11M1

Type of record: Driller's log. Altitude: About 754 feet.

Undifferentiated:			
Mud and limestone	30	30	
Mississippian system:			
Meramec series:			
Limestone	55	85	
Limestone, soft	2	87	W.B.
Limestone	63	150	
Slate	5	155	
Limestone	20	175	
Clay	5	180	
Sandstone	25	205	
Limestone	105	310	W.B. at 215 ft; T.D. 1,288 ft

Well 9/3W-12C1

Type of record: Driller's log. Altitude: About 850 feet.

Undifferentiated:			
Clay	9	9	
Mississippian system:			
Chester series:			
Stone, hard, brown	7	16	
Muck, blue	20	36	
Limestone, hard, blue	18	54	

Table 4.--Selected well logs, Owen County, Indiana--Continued

Well 9/3W-12C1--Continued

Material	Thickness (feet)	Depth (feet)	Remarks
Mississippian system:			
Chester series:			
Shale, blue	3	57	W.B.
Meramec series:			
Limestone, white	23	80	

Well 9/3W-19E1

Type of record: Driller's log. Altitude: About 755 feet.

Quaternary system:			
Recent and Pleistocene series:			
Dirt	12	12	
Mississippian system:			
Chester series:			
Sandstone	4	16	
Cave	6	22	
Sandstone	4	26	
Cave	4	39	"Cinders in cave".
Sandstone	34	64	

Well 9/3W-23F1

Type of record: Driller's log. Altitude: About 690 feet.

Quaternary system:			
Recent and Pleistocene series:			
Sand, red, and clay	35	35	
Clay, blue	53	88	
Mississippian system:			
Meramec series:			
Limestone	1	89	

Well 9/4W-6R1

Type of record: Driller's log (memory). Altitude: About 570 feet.

Quaternary system:			
Recent and Pleistocene series:			
Surface	5	5	
Quicksand	45	50	
Sand and some gravel	24	74	W.B.

Well 9/4W-10N1

Type of record: Driller's log. Altitude: About 560 feet.

Quaternary system			
Recent and Pleistocene series:			
Surface	10	10	
Clay, blue	34	44	
Mississippian system:			
Chester series:			
Sandstone, white	26	70	W.B.

Table 4.--Selected well logs, Owen County, Indiana--Continued

Well 9/4W-10R1

Type of record: Driller's log (memory). Altitude: About 640 feet.

Material	Thickness (feet)	Depth (feet)	Remarks
Quaternary system:			
Recent and Pleistocene series:			
Dirt and sand	90	90	
Mississippian system:			
Chester series:			
Sandstone	1	91	
Shale	27	118	

Well 9/4W-17J1

Type of record: Driller's log. Altitude: About 550 feet.

Quaternary system:			
Recent and Pleistocene series:			
Top soil	16	16	
Mississippian system:			
Chester series:			
Sandstone	14	30	Mud seam at 19 ft
Limestone	11	41	
Shale, sandy	39	80	
Shale, soft, gray	10	90	

Well 9/4W-20A2

Type of record: Driller's log. Altitude: About 555 feet.

Quaternary system:			
Recent and Pleistocene series:			
Surface	4	4	
Mississippian system:			
Chester series:			
Sandstone, yellow	16	20	
Sandstone, gray	15	35	
Sandstone, yellow	10	45	
Shale, sandy, gray	5	50	
Sandstone, yellow	10	60	W.B.

Well 9/4W-20H2

Type of record: Driller's log. Altitude: About 560 feet.

Quaternary system:			
Recent and Pleistocene series:			
Top soil	14	14	
Muck	4	18	
Sand and gravel	20	38	
Muck, sandy	7	45	
Mississippian system:			
Chester series:			
Shale, gray	19	64	
Sandstone	9	73	W.B.
Limestone	3	76	

Table 4.--Selected well logs, Owen County, Indiana--Continued

Well 9/4W-21D2

Coal	.5	173.5	
Fire clay	6.5	180	
Shale, gray	20	200	
Shale, red	5	205	
Shale, gray	--	205	

Well 10/5W-29Q1

Type of record: Driller's log. Altitude: About 655 feet.

Quaternary system:			
Recent and Pleistocene series:			
Top soil			
Pennsylvanian system:			
Lower series:			
Shale, sandy	11	25	
Shale, very-soft, gray	28	53	
Shale, gray	28	81	
Sandstone	9	90	W.B.
Shale, gray	--	90	

Well 10/6W-2K1

Type of record: Driller's log. Altitude: About 575 feet.

Quaternary system:			
Recent and Pleistocene series:			
Top soil	17	17	
Pennsylvanian system:			
Lower series:			
Shale, light-gray	2	19	
Sandstone	8	27	
Shale, gray	3	30	
Shale, sandy	44	74	
Shale, gray	5	79	
Sandstone	21	100	W.B.

Well 10/6W-13F1

Type of record: Driller's log. Altitude: About 585 feet.
