Plainfield, Indiana-46168

REVISIONS

SHEET NO.	DATE	REVISED

Rev. 5-7-75 J.J.W.

GENERAL NOTES

Standard divided lane sections for Federal Aid _____ Projects _____ as shown on Sheet No. _____ to be used on this project.
Standard ramp section _____ to be used on this project. Pavement thickness shall be _____"
Standard single lane pavement sections _____ as shown on Sheet No. _____ to be used on this project.
A _____" Pavement shall be used.

** Typical cross-section as shown on Sheets No. 3 to be used on this project.
** Standards under dates as listed in the Index ~~on this Sheet~~ to be used on this project.
** Grade line as shown on profile represents top of finished surface.
** All Ditches of 1% grade and over shall be sodded except where ditch is in rock cut or where Paved Side Ditch is to be constructed.
** Sodding shall be placed as shown on Standard and Typical Cross-Sections and on Miscellaneous Standard Sheet "MB"
** All Earth Shoulders, Median Area, Cut, and Fill slopes shall be plain or mulched seeded except where sodding is specified.
Overhaul and Added Haul Quantities as shown in the Balances are for information only.
** Excavation Quantities as shown include estimated excavation for Public and Private Approaches. See Table on Sheet No.12
** The final Cross-Sections of the "Grading Contract" shall be the original cross-sections of the "Paving Contract" except that partial or complete cross-sections shall be taken if necessary to determine the actual quantities of Excavation.
Paper Relocation is to be cross-sectioned by the Project Engineer before construction.
** Where existing surface is located outside the Limits of new construction between Sta. 245+00.0 and Sta. 272+50.0 the contractor will be required to remove the present roadway surface and base as directed by the Engineer.
Quantities for Pipe Culvert Headwalls are based on using Standard Headwalls for retaining 2:1 or 3:1 slopes, and Private Drive Headwalls for retaining 4:1 or flatter slopes.
** For "Kinds of Pipe" permitted for each size and classification as shown on the Structure Data Sheet, see Miscellaneous Standard Sheet "MP".
Such part of existing downspout drains that are disturbed by replacing the curb shall be replaced and connected as directed by the Engineer. Payment for this work shall be included in the Contract unit price for _____ Curb"
** The minimum grade for Under Drains shall be 0.20%. Where the profile grade is less than 0.20%, special grades for Subsurface Drains shall be established by the Engineer.
The Contractor must accept the plan quantities of Subbase as given on the Estimate of Quantities Sheet.
** County Road "S.I.-2" shall have 4 "Edge Lines" and "Skip Center Line" as set out in *the Specifications* and "Yellow Barrier Lines" shall be placed as shown on plans.
All Limited Access R/W (L.A.R/W) to be fenced with Chain Link Type Fence (C.L.T.F.) or Farm Field Type Fence (F.F.T.F.) as specified in the plans.
** Curves shall be Superelevated according to the Standards of *sheet 81* (Except Special "Super-Transitions" shall be detailed on Sheet No. ____).
A Keyway Joint is to be constructed on Median side of each pavement.
Contraction Joints shall be placed at all manholes within pavement limits.
Contraction Joints shall be placed at the beginning and end of all radii, at street and alley intersections.
When Guard Rail Type "A" is called for on this project the Contractor shall use the Steel Beam section only.
** When Guard Rail Type "B" is called for on this project the Contractor shall have the option of using either the Steel Beam Section, the Semi Ellipse Aluminum Tubular Section or the Steel Tubular Section.
When Guard Rail Type "C" is called for on this project the Contractor shall have the option of using either the Steel Beam Section, the Semi Ellipse Aluminum Tubular Section or the Steel Tubular Section.
When Guard Rail Type "D" is called for on this project the Contractor shall have the option of using either the Steel Beam Section, or the Semi Ellipse Aluminum Tubular Section.
When Guard Rail Type "E" is called for on this project the Contractor shall have the option of using either the Steel Beam Section, the Semi Ellipse Aluminum Tubular Section or the Steel Tubular Section.
When Guard Rail Type "F" is called for on this project the Contractor shall have the option of using either the Steel Beam Section, the Semi Ellipse Aluminum Tubular Section or the Steel Tubular Section.
** When Guard Rail Type "G" is called for on this project the Contractor shall have the option of using either , the Semi Ellipse Aluminum Tubular Section or the Steel Tubular Section.
When Guard Rail Type "H" is called for on this project the Contractor shall have the option of using either , the Semi Ellipse Aluminum Tubular Section or the Steel Tubular Section.
Wherever reference is made, on the design plans to Subbase Type I or II or Subbase Type II, this reference is to be interpreted as "Subbase" and the materials required will conform to a "Supplemental Specification for Subbase".
** The Quantity "Furnishing and Placing Seed (Crown-Vetch)", shown on the estimate of quantitiy sheet, is to be used at those locations where the slopes are 3 to1 or steeper or in an area requiring sand cut or sand fill or as directed by the Engineer.
** Movement of Excavation is shown on Mass Haul Diagram on Sheet No.13 with the entire project being in one balance as shown on Sheet No.13.

** REPRESENTS GENERAL NOTES REQUIRED

Note:
See Title sheet for additional Road Standards.

GENERAL NOTES

No present structure at proposed bridge site.
Depth of footings to be extended if found necessary. See Art. 206.11(c) Specifications.
Piles shall have minimum bearing value shown on detail drawings. Determine pile lengths by Art. 701 of Specifications.
For details of steel encased concrete piles see Bridge Standard C1, and applicable articles in the Specifications.
Reinforcing steel covering shall be 2½ inches in top and 1 inch min. in bottom of floor slabs, 3 inches in footing except bottom steel which shall be 4 inches and 2 inches in all other parts, unless noted.
Concrete in footing and pier stems up to construction joint to be class "B".
Concrete in superstructure to be class "C".
Concrete in end bents, top of pier stem down to construction joint and steel encased concrete piles to be class "A".

Continuous concrete pours shall be required between construction joints as shown on detail plans.
Waterproof back of mudwalls, wingwalls, in accordance with Art. 702.22 of the Specifications.
Bevel forms ⊥ under copings; and chamfer exposed edges 1 inch unless noted.
Construct riprap at location shown on layout and Spur Dike & Channel Change Details.
Tolerance in position of pile head maximum 2 inches in end bents.
All railing posts to be constructed perpendicular to grade.
Only the top of end bent caps, front face of mudwalls, face of deck coping and underside of the bridge floor from coping to face of outside beam to be sealed in accordance with Article 702.20 of the Specifications.
For pay items covering this structure see Bridge Estimate of Quantities.
See special provisions for items included in this contract.
As an alternate, prestressed concrete piles may be substituted for steel Encased Concrete Pile and/or Untreated Timber Piles See Br. Std. C4 and the Special Provisions.
Existing structure, located 350' down stream, is to be removed.

GENERAL PLAN

CONTINUOUS COMPOSITE STEEL BEAM BRIDGE
5 SPANS 66'-0, 3 @ 82'-6, 66'-0 — SKEW 30°00'00" RT.

Scale: 1"=1'-0

NOTE:
The Contractor may use welded channels or 7/8"φ welded stud as alternate shear connectors. If used they shall have equivalent shear value and the proposed size and spacing submitted for approval.

SHEAR CONNECTOR TYPICAL DETAIL
Scale: 1½"=1'-0

FABRICATION AND ERECTION NOTES

High Strength Bolts 7/8"φ unless noted; Open Holes 15/16"φ unless noted.
Shop Paint : Zinc Silicate Paint } See Special Provisions.
Field Paint : Vinyl Finish Coat }

The Contractor shall prepare detailed working or shop drawings to enable him to fabricate, erect, and construct all parts of the work in conformity with the Engineer's drawings and specifications and shall submit four (4) copies to the Engineer. See Article 711.04 of the Specifications.

The shop details shall show a plan of matchmarking for all reamed pieces.

All splice plates to be removed, cleaned, and deburred after reaming. Splice plates shall not extend beyond the end of beam after bolting for shipment.

Beams must be cambered to a smooth curve. Camber must be checked after shop welding is completed and while beams are supported in such a way as to have no bending moment in the direction of camber.

Holes for beam splices, and splice plates shall be subpunched or subdrilled and reamed to size while assembled. See Article 711.24 of the Specifications. Flange splice bars shall have planed or rolled edges and holes in bars shall be subdrilled and reamed or drilled full size while assembled.

Diameter of holes in all material connecting top shoes to beam flanges to be 1"φ. Bolts connecting beam flange to top shoe shall extend into top shoe a minimum of 1 inch.

Shims between beams and top shoe may be built up. No shim shall be less than 1/8" thickness

Structural steel shall be erected using sufficient full size drift pins to permit placement of bolts without damage thereto and to facilitate setting splices to grade. At the time of erection not less than 50 percent of the holes in any connection shall be filled with bolts. The bolts shall not be tightened more than snug tight at this stage. Any drifting required shall be only such that will draw the parts into position but not sufficient to enlarge the holes or distort the metal. Unfair holes shall be reamed or drilled.

Rivets shall not be used in the assembly of structural steel.

As soon as the Engineer has approved the field welds, all welds and any surface from which the shop coat has been omitted or becomes worn off or has otherwise become defective shall be thoroughly cleaned of all charred paint or any foreign matter and completely covered with one coat of shop paint.

Estimated weight of structural steel 485,900 lbs. (Included 9,400 lbs. for Toothed Exp. Joint, 126,000 lbs. for A572-50, 400 lbs. for A-588 and 5900 lbs. for A-514).

The weight of high strength bolts is not included in the estimated weight of structural steel. The cost of these bolts shall be included in the cost of structural steel.

Materials as listed on the shop drawings which do not require mill test reports may be changed from that shown on the contract plans subject to approval. The material specification shall be given on the shop drawings if different than that on contract plans. See Article 711.07 of Specifications.

All field splices are optional (except as noted) subject to "Regulations pertaining to the movement of over length concrete and steel beams on State Highways" as stated in Supplement #2 to General Letter #19-71 dated August 19, 1971. Shop plans shall indicate which splices the Contractor intends to eliminate and also means of transportation whether by rail or over State Highways.

All structural steel shall conform to ASTM A-36 unless otherwise noted.

The shop plans shall indicate whether reaming or drilling is to be done in shop or field. If shop reaming or drilling is used the beams shall be assembled in accordance with no load camber and reaming diagram. If the beams are shop reamed or drilled, full size drift pins shall be used in erection, and progressive beam assembly will be permitted. See Art. 711.44 of the Specifications.

Structural steel for welding may be flame cut if the flame cutting is mechanically guided. Hand flame cutting shall be used only when approved, and the surface is further treated by milling, grinding, or chipping and grinding.

A-588 may be used in lieu of A-572 at contractor's option at no increase in cost.

NOTE

Diaphragm connections to beams may be bolted in lieu of field welded connections. If the Contractor elects to use connections other than shown in the contract plans, he shall submit details to the Engineer for approval. He shall assume full responsibility for layout of all diaphragm connections and for the accuracy of all fitted parts. No increase in pay weight will be permitted.

DATA USED FOR DESIGN AND DETAILS

LIVE LOADS: HS20-44 loading with impact and distribution of loads in accordance with 1973 AASHO Specifications.

DEAD LOAD: Actual weight plus 35 #/sq.ft. of roadway to provide for overlay plus some additional future wearing surface.

FLOOR SLAB: Designed for 16,000 pound wheel plus impact, and with 1½" monolithic wearing surface. Structural slab depth = 6½ inches

ALLOWABLE STRESSES: To be in accordance with 1973 AASHO Specifications.

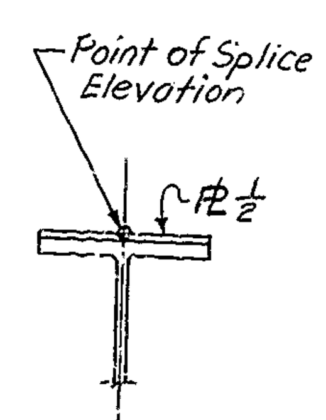
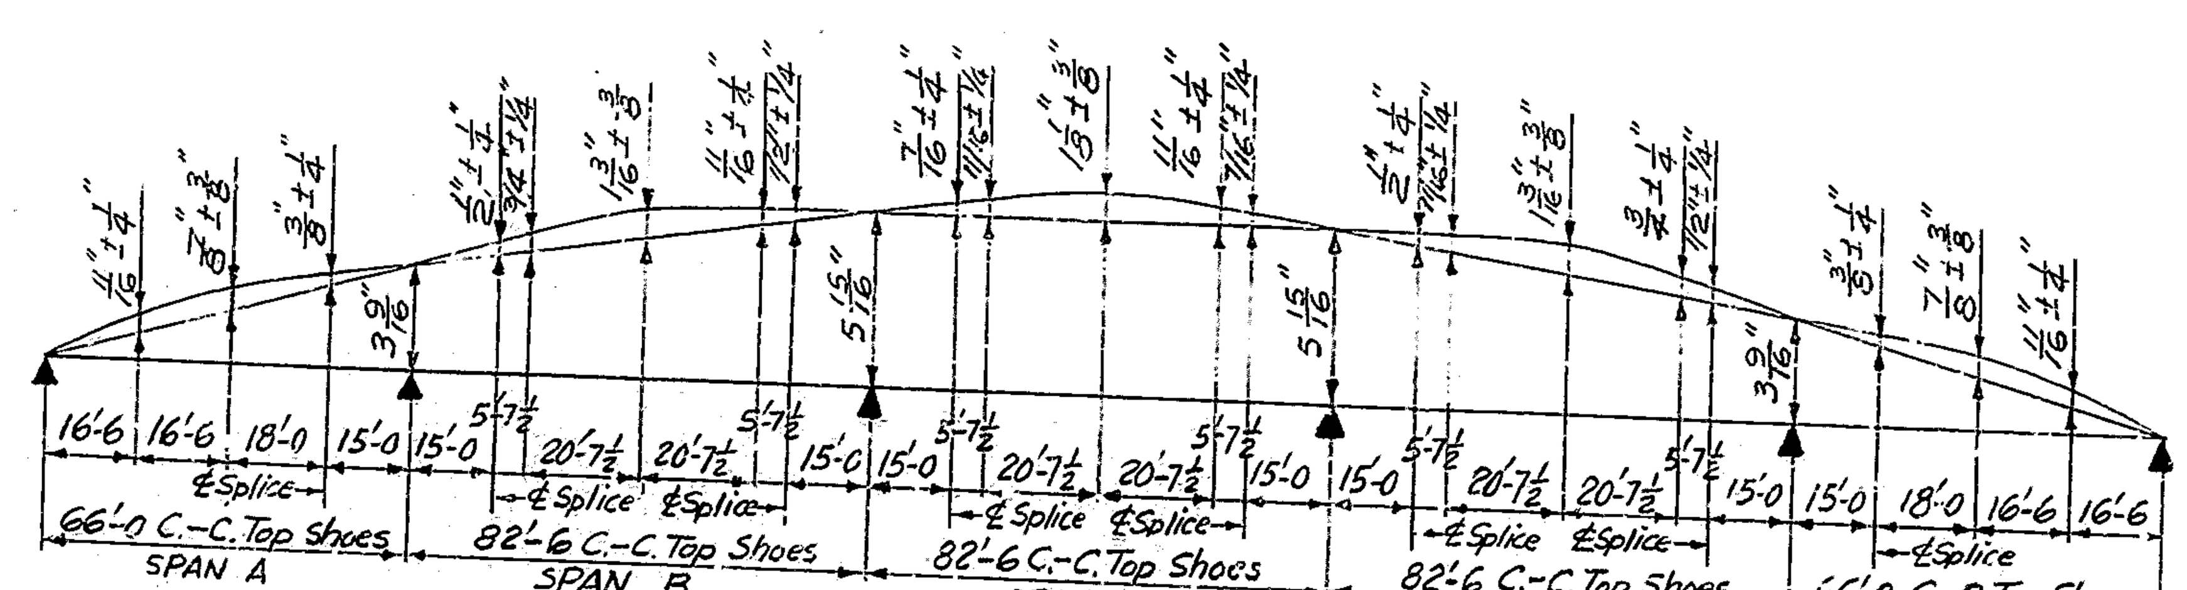
Splice elevations are with falsework removed and carrying steel deadload only. Top of beam splice plates shall be adjusted to the above elevations before bolting field splices.





NO LOAD CAMBER AND REAMING DIAGRAM
No Scale

NOTES

See Br. Std. SH1 for Steel Shoe Detail.
See Drwg. S11 for Fabrication And Erection Notes and Additional Details.

GENERAL PROCEDURE

(1) After all structural steel has been erected and bolting and welding completed, adjust the superstructure longitudinally so that dimension "C" from the ℄ Top Shoe to the face of mudwall at Bent № 6 equals the value shown in TABLE II for the prevailing temperature.
(2) With the superstructure in the adjusted position called for in (1), weld the Fixed Shoes to the Anchor Plates at Pier № 2.
(3) Adjust the Expansion Plates under each Expansion Shoe in accordance with dimension "A" or "B" in TABLE I for the prevailing temperature. Note that dimension "A" is always the distance from a vertical line through the ℄ of Top Shoe in a direction away from the Fixed Shoe. Weld the Expansion Plates to the Anchor Plates.
(4) Set the Toothed Expansion Joint at Bent № 6 and adjust it to the top of plate elevations shown on Drwg. S11 using the double nuts for adjustments.
(5) Adjust the Toothed Expansion Joint transversely so that the opening "f" between the teeth are equal and longitudinally so that dimension "D" corresponds to the value shown in TABLE II for the prevailing temperature.
(6) Screed elevations shall be determind by adding the Concrete Dead Load Deflections to the required final concrete elevations at all screed points. Take elevations at all screed points on top of beam adjacent to screed points. Subtract these elevations from the elevations corrected for deflection and use the resulting dimension as the height for setting the screed or coping form above that point. This dimension remains constant regardless of how much or in what order the concrete is poured. Do not set screed or coping forms by leveling. Screed elevations will be furnished on request.
(7) No concrete in the floor is to be poured until the above operations are completed.

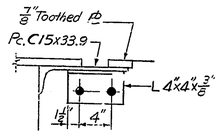
VIEW C-C



SECTION D-D

NOTES

Bolts 3/4"φ unless noted. Open Holes 13/16"φ unless noted.
If curves in plates are flame cut, they shall be ground smooth.
Expansion Joints are to be assembled in the shop in their relative erection position and inspected for fit.
For Toothed Expansion Joint setting see Drwg. S12.
Top of Expansion Joint to comform to Roadway Crown configuration.
Estimated weight of Structural Steel in Toothed Expansion Joint 9,400 lbs.

NOTES

For Sections A-A, B-B, Corner Details, Bill of Materials and Additional Details see Drwg. S15.

For Reinforcing Bar Notes see Br. Std. C1.

For Railing Details see Br. Stds. BR1 thru BR4.

Surface seal the tops of overlay dams and mudwalls.

After structural steel has been erected, concrete forms shall not be blocked against the expansion end of the steel in making any pours adjacent to steel spans.

Sequence of pours to be made in order of pour numbers. All superstructure construction joints are optional except as noted, and pours may be made continuous provided the pour terminates at a construction joint indicated on the plans. The Contractor may change the width of pours, sequence of pours, or location of construction joints subject to the approval of the Engineer.

Overlay Dams at ends of floor slab shall be poured monolithic with the slab.

The top reinforcing in the slab shall be securely tied down to the floor forms and/or beams to prevent uplift during concrete placement.
