Electronic Cigarettes

What are Electronic Cigarettes?

Electronic cigarettes (or e-cigarettes) produce a mist or aerosol upon each inhalation that resembles and tastes like the smoke produced by combustible tobacco products. E-cigarettes fall within a broad class of products known as electronic nicotine delivery systems (ENDS), which also include electronic cigars (e-cigars), electronic hookahs (e-hookahs), vapor (vape) pens, and other products.

These products are designed with a rechargeable battery-operated heating element that volatilizes the chemical constituents contained within replaceable cartridges. These cartridges may or may not contain nicotine.

The amount of nicotine varies widely based on cartridge brand and strength, but is generally 6-18mg of nicotine per cartridge, equivalent to about ½ of a pack to 1 ½ packs of cigarettes. Cartridges claiming to contain zero nicotine are also available; however, preliminary testing of some samples of electronic cigarettes by the FDA has revealed inconsistencies with product labeling and nicotine content.¹

The concerns about e-cigarettes

- E-cigarettes are being promoted as a less dangerous alternative to cigarettes or smoking cessation aid, however e-cigarettes have not been approved as safe by the U.S. Food and Drug Administration (FDA). The FDA has warned the public that e-cigarettes may contain various toxic and carcinogenic (cancer causing) chemicals.

- A laboratory analysis of electronic cigarette samples conducted by the U.S. Food and Drug Administration has found that they contain carcinogens and toxic chemicals such as diethylene glycol, an ingredient used in antifreeze.²

- E-cigarettes emit an aerosol through a process similar to passive tobacco smoking called *passive vaping*. The health effects of exposure to aerosol from e-cigarettes are currently unknown; however, research shows that the aerosol releases measurable amounts of carcinogens and other toxins into the air, including nicotine, formaldehyde and acetaldehyde.³

- Recent research has demonstrated that e-cigarette aerosol has a high concentration of ultrafine particles. Exposure to fine and ultrafine particles may exacerbate respiratory conditions and constrict arteries.⁴,⁵

- Companies sell flavored nicotine solutions in wide array of flavors, many of which are candy or fruit flavors, including vanilla, banana, almond, vanilla ice cream, cherry, mint, peach cobbler, and mint chocolate, which may appeal to youth.

- The solutions can be very concentrated. This creates a risk of overdosing or poisoning, because the lethal dose of nicotine for adults is 30-60mg if swallowed, and for children is just 10mg. In 2007, e-cigarette exposure accounted for less than 1% of e-cigarette and cigarette exposure calls to poison control centers. By February, 2014, they accounted for 42% of combined monthly e-cigarette and cigarette exposure calls.⁶
E-cigarette use and popularity

- A study published by the CDC found that over 1 in 3 (36.5%) adult cigarette smokers tried an e-cigarette in 2013, an increase from about 1 in 10 adults (9.8%) in 2010. E-cigarette use was significantly higher among current smokers compared to both former and never smokers. The health effects of dual-use of e-cigarettes and combustible tobacco are unknown.

- Among adults in Indiana, sharp increases were found in the percentage of smokers and former smokers who report ever having used e-cigarettes between 2013 and 2015. Current smokers (68.0%) were significantly more likely to have used e-cigarettes than never smokers (4.0%). Former smokers (14.8%) were significantly more likely than those who have never smoked to have used e-cigarettes, suggesting that e-cigarettes may appeal to former smokers who have successfully quit smoking and that these products may prompt relapse. Additionally, 4.6% of Indiana adults report currently using e-cigarettes.

- In 2014, e-cigarettes were the most commonly used tobacco product among middle and high school students in the U.S. and in Indiana. The percentage of youth in the U.S. who currently use e-cigarettes tripled among high school students from 2013 (4.5%) to 2014 (13.4%). Among middle school students, prevalence increased by a similar magnitude, from 1.1% to 3.9%.

- In Indiana, 11.2% of middle school students and 29.0% of high school students reported ever using e-cigarettes in 2014. Additionally, 5.2% of middle school students and 15.6% of high school students reported current use of e-cigarettes. Among current cigarette smokers, 63.7% of middle school students and 65.9% of high school students reported currently using e-cigarettes.

Regulation of E-cigarettes

The FDA released the proposed deeming rule to regulate additional tobacco products, including e-cigarettes in April, 2014. Visit this page to access information on e-cigarettes from the FDA, and progress with regulation: [http://www.fda.gov/NewsEvents/PublicHealthFocus/ucm172906.htm](http://www.fda.gov/NewsEvents/PublicHealthFocus/ucm172906.htm)

States, communities, businesses and schools have the authority to prohibit e-cigarette use in smoke-free air policies. Over 100 municipalities and three states prohibit e-cigarette use in smoke-free environments. In Indiana, e-cigarettes are included in the Indianapolis and Hancock County smoke-free air laws and the Indianapolis International Airport’s smoke-free air policy.
Marketing tactics

- E-cigarettes are being marketed as better smelling, cheaper, and flavorful alternatives to combustible tobacco products.

- These products are also being advertised in misleading ways. The picture (right) of a mall kiosk advertises the e-cigarette as a “safe alternative to smoking.”

- Some e-cigarette brands are available at mall kiosks where youth are present and are promoted heavily online as well, receiving celebrity endorsements.

- The tobacco industry owns some brands of e-cigarettes, such as Blu, MarkTen and Vuse. MarkTen, manufactured by Philip Morris, was test-marketed throughout Indiana in 2013 and is now available nationwide. Vuse, manufactured by RJ Reynolds, is being heavily promoted through television commercials that air during prime time programming.

Want to quit smoking?

- There are methods for treating tobacco use addiction that have been thoroughly researched and are endorsed by health care professionals, specifically, the U.S. Public Health Service Clinical Practice Guideline: [http://wwwahrqgovprofessionalscliniciansprovidersguidelines-recommendationstobaccoindexhtml](http://wwwahrqgovprofessionalscliniciansprovidersguidelines-recommendationstobaccoindexhtml)

- There are seven first line medications that the FDA has approved for treating tobacco use addiction, and e-cigarettes are not one of them.

- Consumers need to know that e-cigarettes are not an FDA-approved device. Promotion of these products as a cessation aid without approval of the FDA is prohibited.\(^1\)

- Tobacco users should contact a health care provider for assistance and call 1-800-Quit-Now or visit [www.QuitNowIndiana.com](http://www.QuitNowIndiana.com) for evidence-based support, advice and resources.
